

Helix Space v2 — Classrooms, Assignments, Plans

Three additions to Spaces. Each works the same way for everyone — create a Space, share one invite link, and the rest happens in the editor you already use.

1 · CLASSROOM SPACES

A Space can now be a team or a classroom

A team works like before — everyone shares projects with everyone. A classroom adds one role: the person who created it (the instructor) can post assignments and open each student's assignment work read-only. Students still own their workspaces, and classmates can't see each other's assignment work.

HOW IT WORKS

One field on the Space (`kind: team | classroom`) switches the behavior. Access is checked on the server for every file read: owner → full access; Space member → shared projects only; classroom instructor → submissions linked to their assignments, read-only.

2 · ASSIGNMENTS

Hand out starter code, collect work, review with AI help

INSTRUCTOR

Creates an assignment — instructions, due date, optional starter project

STUDENT

"Start" copies the starter into their own workspace — full editor + AI

STUDENT

Submits when done (can keep working until it's graded)

INSTRUCTOR

Opens the work read-only, runs an AI review, writes feedback + a grade

STUDENT

Sees feedback and grade once it's marked reviewed

HOW IT WORKS

Each submission is one database row tying student ↔ assignment ↔ their copied workspace. The copy is independent (starting from a 400-file-max snapshot of the starter). The AI review is a single model call with the instructor's configured model; its output stays instructor-only.

3 · PLANS & SEATS

Free plan for small groups, seats for bigger ones

Every Space starts free: up to 5 members and 2 assignments. A subscription adds seats (one per member) and removes the assignment limit — classrooms automatically get the education rate. If a subscription ends, nothing is deleted and nobody is removed; the Space just stops accepting new members past the free limit.

HOW IT WORKS

Checkout and billing management happen on Stripe's hosted pages; Helix stores only the plan, seat count, and renewal date on the Space. A signature-verified webhook (</api/billing/webhook>) keeps that in sync. All limits are enforced server-side on the join and assignment-creation routes.
