

What's New in **Helix** — in Plain English

Three upgrades that make building software here faster, safer, and more like having a teammate. No jargon.

1 · **FASTER**

Your project remembers its tools

Like leaving your tools out on the workbench instead of unpacking the whole toolbox every single time.

BEFORE

Every time you ran your app, it re-downloaded everything first — minutes of waiting, each run.

AFTER

It sets up once and remembers. The next run starts in **A FEW SECONDS**. You can even customize the setup.

2 · **SAFER**

Saving to GitHub the proper way

Like saving a real document with full edit history — not slipping a loose photocopy into the drawer.

BEFORE

Sent one flat snapshot. If a teammate had changed the same project, your save could clash or overwrite.

AFTER

Real version history. It pulls in teammates' latest work first, and warns you instead of clobbering it.

3 · **SMARTER**

An AI teammate checks your work

Like a senior teammate who quietly reviews every change before it ships — and tells you what to fix.

BEFORE

You opened a pull request on GitHub and hoped someone had time to review it.

AFTER

Flip it on for a repo, and Helix reviews every pull request automatically — pointing at the exact lines with problems, then a clear **"SHIP IT"** or **"HOLD"**.
