

# Helix Agent Platform

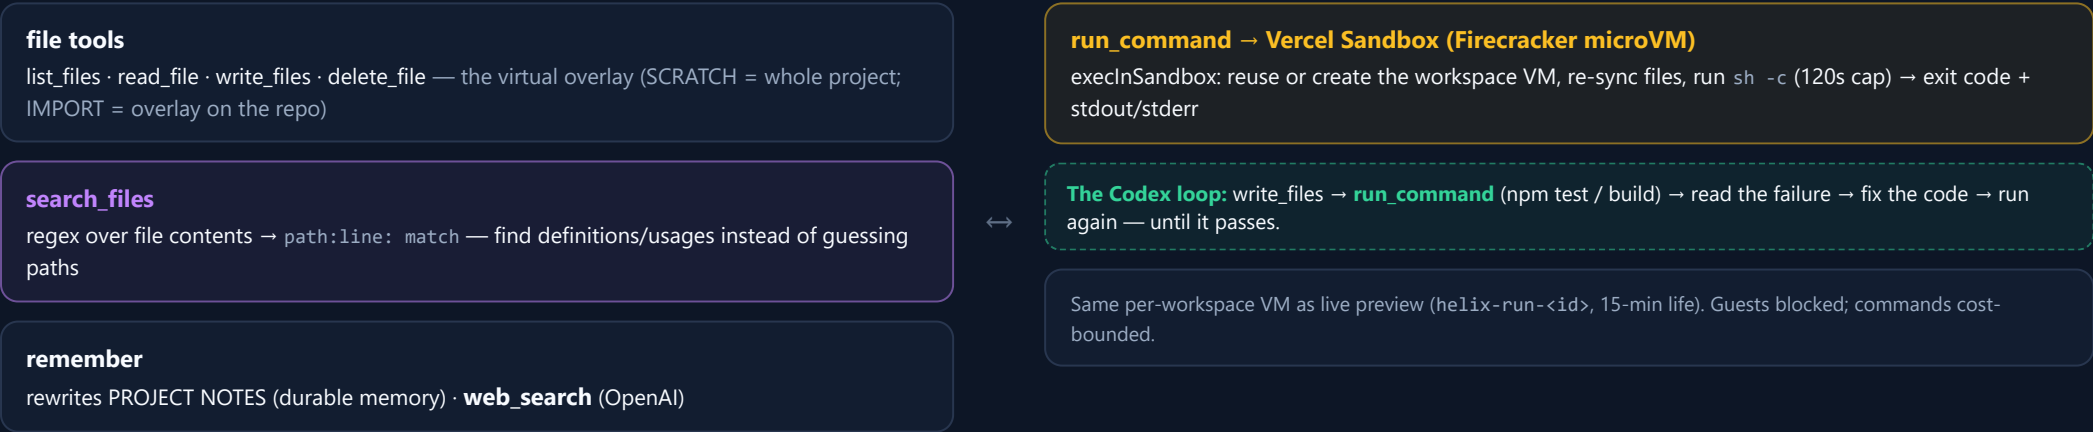

How an agent turn runs end to end — streaming, sandboxed command execution, repo tools, background tasks, and diff/review — plus the per-host git layer. Shipped 2026-06-12.

## 1 · STREAMING TURN PIPELINE

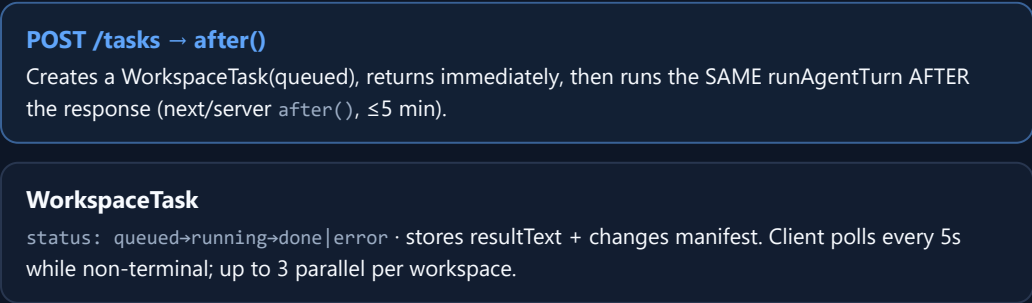

events: {"type":"activity","label":"running `npm test`..."} ... {"type":"final","text","actions","changes","guestRemaining"}

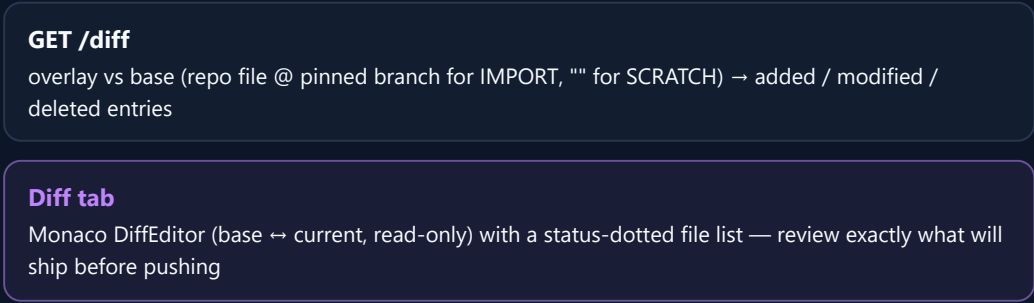

## 2 · THE TOOL BELT (THE AGENT'S HANDS)

## 3 · BACKGROUND TASKS

## 4 · DIFF & REVIEW

Zombie sweep: a task running >6 min (platform killed the fn) is marked timed-out on next GET.

**POST /review**

one no-tools model call: flags correctness / security / data-loss issues with file:line, ends with a ship/hold verdict — lands in chat history

5 · PER-HOST GIT LAYER (EVERY CHANGE SHIPS TO ITS HOST)

**Git info bar**

provider · repo · base branch · N changed → Diff tab.  
Each workspace records its *provider*.

**GitProvider adapters — withGitAuth(token)**

GitHub (OAuth/PAT) · GitLab · Bitbucket · Azure DevOps ·  
Gitea/Forgejo/Codeberg (pasted token). listRepos · fetchTree · readFile ·  
**pushFiles** (one commit, branch + empty-repo bootstrap) · createRepo ·  
PR/MR.

**Push dialog**

new branch + PR, or straight to the base branch —  
copy adapts per host ("merge request" on GitLab).
